

Three Auto Factories Install SIGMA's HYDROTEC System

An international auto manufacturer has now installed HYDROTEC in three US factories. The product, Maxi 100 Class D, met the job specifications and provided the load rating required for the site.

These Jobs All Presented One Key Challenge: The product must be delivered and installed within a precise time frame. Each July, these auto plants close for maintenance and infrastructure upgrades, so the work must be completed in time for the factories to be up and running by month's end. In 2015, HYDROTEC was successfully delivered and installed in the Kentucky facility. The customer was so pleased with the results, they placed HYDROTEC orders for two more US factories this year.

A Key Benefit of HYDROTEC is the Ease of Installation. The channels are simply placed in the ground and concrete is poured around them, unlike competitors' trench drains, which have to be suspended for installation.

Because of this innovation, each piece takes only minutes to install, which provides significant time and cost savings. This was crucial to the auto manufacturer because of the maintenance and manufacturing schedule.

Based on the positive experience with regard to quality, service, efficiency and performance, the customer is abandoning its previous trench drain product in favor of HYDROTEC.
